### Introduction to the Stata Language

#### Mark Lunt

Centre for Epidemiology Versus Arthritis University of Manchester

# **Topics Covered Today**

- Getting help
- Stata Windows
- Basic Concepts
- Manipulation of variables
- Manipulation of datasets

### Introduction to R for Stata Users

- I prefer Stata for simple basic data analysis
- Learning 2 languages at once would be confusing for most people
- I suggest using Stata until you need to change
- I'm writing "R for Stata users" which directly converts this course to R
- If you are familiar with R, there are similar practicals using R on the Stata home page

#### Introduction Getting Help Stata Windows Basic Concepts Manipulating Variables Manipulating Datasets Command-line vs. Point-and-Click

- Command-line requires more initial learning than point-and-click
- Commands must be entered exactly correctly
- Only option for any serious work
  - Reproducible
  - 2 Editable
  - More efficient
- Some commands can be written more efficiently via point-and-click

# **Getting Help**

- Help
- Manuals
- Search
- Stata website
- Statalist
- Me

Command Window Variables Window Review Window Results Window

# Stata Windows

- 2 must exist:
  - Results
  - Command
- 2 others usually exist
  - Review
  - Variables
- Others can exist (data editor, graph, do-file editor, help/log viewer)

Command Window Variables Window Review Window Results Window

# Command Window: Syntax

#### command [varlist] [, options]

- Roman letters: entered exactly
- Italic letters: replaced by some text you enter
- Square brackets: that item is optional
- Example above means means:
  - Command is called "command"
  - Command name may be followed by a list of variables
  - Options may follow a comma

Command Window Variables Window Review Window Results Window

# **Command Window**

- Can navigate through previous commands with PageUp and PageDown.
- Pressing tab key will complete a variable name as far as possible
- Case-sensitive: height and HEIGHT are different variables
- Syntax must be *exact* (although abbreviations are possible)
  - Only one comma, before all options
  - Space before opening parenthesis was most common error, now accepted (since Stata 12). (e.g. level(5), not level (5)).

Command Window Variables Window Review Window Results Window

## Variables window

- List of all variables in current dataset
- Clicking adds variable name to command window
- May contain label if one has been defined

Command Window Variables Window Review Window Results Window

# **Review Window**

- List of commands entered this session
- Clicking on a command puts it in command window
- Double-clicking runs the command
- Can be saved as a script, called a "do-file"

Command Window Variables Window Review Window Results Window

# **Results Window**

- Limited size: use a log file to preserve results
- Blue = clickable link
- $\bullet$  Scrolling controlled by <code>Return</code>, <code>Space</code> and <code>q</code> keys.
- set more [on | off]

 Introduction
 Do-Files

 Macros

 Manipulating Variables
 Lists

# **Basic Concepts**

- Do-files
- Log files
- Interaction with Operating System

#### Macros

• Variable and number lists

Do-Files Log Files Interaction with Operating System Macros Lists

# **Do-Files**

- List of commands
- Can be run from stata with the command do "do-file.do"
- All data manipulation and analysis should be done using a do-file.
  - Perfectly reproducible
  - Can see exactly what was done
  - Easy to modify

**Do-Files** Log Files Interaction with Operating System Macros Lists

# Projects

- A way to keep all files used in analysis easily accessible
- Can contain do-files and datasets
- Example

Introduction<br/>Getting HelpDo-Files<br/>Log FilesStata Windows<br/>Basic Concepts<br/>Manipulating Variables<br/>Manipulating DatasetsInteraction with Operating System<br/>Macros<br/>Lists

- Stata looks for a file called profile.do every time it starts.
- If it finds it, it runs it
- Useful for

Profile.do

- User-defined menus
- Logging commands
- See help profilew for details

 Introduction
 Do-Files

 Getting Help
 Log Files

 Stata Windows
 Interaction with Operating System

 Basic Concepts
 Macros

 Manipulating Variables
 Lists

- Results window of limited size: must log results
- Can use plain text or SMCL (stata markup and control language)
- Top of do file should be:

Log Files

capture log close log using myfile.log, [append] | [replace] ([text] | [smcl])

 Introduction
 Do-Files

 Getting Help
 Log Files

 Stata Windows
 Interaction with Operating System

 Manipulating Variables
 Macros

 Manipulating Datasets
 Lists

- cd Change directory
- pwd Display current directory
- mkdir Create directory
- dir List files in current directory
- shell Run another program
- Can use either "/" or " $\$ " in directory names.
- Safer to use "/"
- Path names containing spaces must be surrounded by inverted commas.

IntroductionDo-FilesGetting HelpLog FilesStata WindowsInteraction with Operating SystemBasic ConceptsMacrosManipulating VariablesLists

- Macro name is replaced by definition text when command is run.
- Very useful for making do-files portable

Macros

- Directories used are defined first using macros
- Change in location of data or do-files only means changing macro definitions

### Macro Example

• Definition: global mymac C:/Project/Data

• Use:

- use "\$mymac/data"
- Loads the file C:/Project/Data/data

 Introduction
 Do-Files

 Getting Help
 Log Files

 Stata Windows
 Interaction with Operating System

 Basic Concepts
 Macros

 Manipulating Datasets
 Lists

- Global macro retains definition until end of session
- Local macro loses definition at end of do-file

	Definition	Use
Global	global mymac <i>defn</i>	\$mymac
Local	local mymac <i>defn</i>	`mymac'

Local vs Global macros

 Manipulating Variables
 Lists

# Variable Lists

- Shorthand for referring to a lot of variables
- prefix\* means all variables beginning with prefix
- firstvar-lastvar means all variables in the dataset from firstvar to lastvar inclusive.
- Type help varlist for more details

Do-Files Log Files Interaction with Operating System Macros Lists

## Number Lists

Symbol	Meaning	Example	Expansion
	list of numbers	123	123
x/y	whole numbers from x to y inclusive	1/5	12345
<i>x y</i> to <i>z</i>	numbers from x to z, increasing by $y - x$	5 10 to 20	5 10 15 20
x y : z	same as x y to z	5 10:20	5 10 15 20
x(y)z	numbers from x to z, increasing by $y$	10(10)50	10 20 30 40 50
x[y]z	same as $x(y)z$	10[10]50	10 20 30 40 50

Number Lists

Introduction Getting Help Stata Windows Basic Concepts Manipulating Variables

Creation & Modification Labelling Selecting variables

# **Manipulating Variables**

- generate & replace
- egen
- Labelling
- Selecting variables

Creation & Modification Labelling Selecting variables

#### generate

- Used to create a new variable
- Syntax: generate [type] newvar = expression
- newvar must not already exist
- type, if present, defines the type of the data
- *expression* defines the values: e.g.
  - generate ltitre = log(titre)
  - generate str6 head = substr(name, 1, 6)

Introduction Getting Help Stata Windows Basic Concepts Manipulating Variables

Creation & Modification Labelling Selecting variables

# Variable Types

type	size (bytes)	min	max	precision	missing
byte	1	-127	126	integers	
int	2	-32,767	32,766	integers	
long	4	-2,147,483,647	2,147,483,646	integers	
* float	4	-10 <sup>36</sup>	10 <sup>36</sup>	7 digits	
double	8	-10 <sup>308</sup>	10 <sup>308</sup>	15 digits	
str <i>n</i>	п			Ũ	" "
strL	varies				

Available data types

Creation & Modification Labelling Selecting variables

# Missing Values

- Numerical variables can have several different missing values:
  - ., .a, .b, etc
  - May be useful if you know why a variable is missing
  - if variable != . may not catch all missing values
- All missing values are *greater* than any number representable by that datatype.
  - Can exclude all missing values with
    - if variable < .
  - gen old = age > 65 if age < .

Introduction Getting Help Stata Windows Basic Concepts Manipulating Variables

Creation & Modification Labelling Selecting variables

### replace

- Similar to generate
- Cannot change type
- newvar must already exist

Creation & Modification Labelling Selecting variables

#### egen

- Extended GENerate
- Has more functions available
- User can write their own egen functions
- No ereplace: must drop the existing variable and create a new one
- Examples of its use in the practical
- See help egen for details

Creation & Modification Labelling Selecting variables

# Labelling

- Need to label variables themselves
  - show exactly what the variable measures
- Need to label values of a variable
  - Only for categorical variables
  - First define a label
  - Then assign it to a variable
  - Easier to assign same label to a number of variables
  - Can label different missing values

Creation & Modification Labelling Selecting variables

## Labelling a variable

#### Syntax: label variable varname "Description"

#### Example: label variable height "Height in m."

Creation & Modification Labelling Selecting variables

### Labelling values

- Syntax: label define *labelname* 1 "string1" ... label values *varname labelname*
- Example: label define yesno 0 "No" 1 "Yes" label values question1 yesno label values question2 yesno

Introduction Getting Help Stata Windows Basic Concepts Manipulating Variables

Creation & Modification Labelling Selecting variables

### Selecting variables

- drop *varlist*
- keep varlist

Creation & Modification Labelling Selecting variables

# Formatting Variables

- Adding a format to a variable changes how it is presented, not how it is stored
- Most useful for dates:
  - Stored as days since 1/1/1960
  - Can be formatted in human readable form
  - Date format: "%d" followed by string
  - E.g. "%dD/N/CY" gives 01/01/1960
- Type "help format" for details

Basics Appending Datasets Merging Datasets Other dataset commands

# Manipulating Datasets

- use & save
- append
- merge
- browse **and** edit
- preserve **and** restore

Basics Appending Datasets Merging Datasets Other dataset commands

#### use

- use "filename" reads a file into stata
- If there is already a file in stata, need use "filename", clear
- Always use inverted commas
- Easier to use the menu or button-bar

Basics Appending Datasets Merging Datasets Other dataset commands

#### save

- save "filename" saves the current dataset as "filename"
- If "filename" already exists, need save "filename", replace
- Option saveold allows saving in format of a previous version of stata
- If you do not include a directory in *filename*, stata will try to save it in the current directory

Basics Appending Datasets Merging Datasets Other dataset commands

# **Combining Datasets**

#### • append

- more subjects, same variables
- append using *filename*
- merge
  - same subjects, more variables
  - merge 1:1 identifier using filename

Basics Appending Datasets Merging Datasets Other dataset commands

# Appending Data: Example

ID	common_1	common_2	file1_1	file1_2
1	<i>a</i> 1	$b_1$	<i>C</i> <sub>1</sub>	$d_1$
2	$a_2$	b <sub>2</sub>	<i>C</i> <sub>2</sub>	$d_2$
3	$a_3$	$b_3$	<i>C</i> <sub>3</sub>	$d_3$

Appending Data: File 1

ID	common_1	common_2	file2_1	file2_2
4	$a_4$	$b_4$	$e_4$	$f_4$
5	$a_5$	$b_5$	$e_5$	<i>f</i> <sub>5</sub>
6	$a_6$	$b_6$	$e_6$	<i>f</i> <sub>6</sub>

Appending Data: File 2

Basics Appending Datasets Merging Datasets Other dataset commands

# Appending Data: Example

ID	common_1	common_2	file1_1	file1_2	file2_1	file2_2
1	a <sub>1</sub>	<i>b</i> <sub>1</sub>	<i>C</i> <sub>1</sub>	$d_1$		
2	$a_2$	b <sub>2</sub>	<i>C</i> <sub>2</sub>	$d_2$		
3	$a_3$	$b_3$	<i>C</i> <sub>3</sub>	$d_3$		
4	$a_4$	$b_4$			$e_4$	$f_4$
5	$a_5$	$b_5$			$e_5$	f <sub>5</sub>
6	$a_6$	$b_6$			$e_6$	<i>f</i> <sub>6</sub>

Appending Data: Combined Files

Basics Appending Datasets Merging Datasets Other dataset commands

# Merging Data

- Need an identifier (one or more variables on which to match observations)
- Both files must be sorted by this identifier
- All observations from both files are used
- Variable \_merge says whether observation was in first file, second file or both.

Basics Appending Datasets Merging Datasets Other dataset commands

# Merging Files: example

idno	var1	var2
1	<i>a</i> 1	$b_1$
2	$a_2$	$b_2$
3	$a_3$	$b_3$

Merging Data: File 1

idno	var3	var4	
1	<i>C</i> <sub>1</sub>	$d_1$	
3	<b>C</b> 3	$d_3$	
4	<i>C</i> <sub>4</sub>	$d_4$	

Merging Data: File 2

Basics Appending Datasets Merging Datasets Other dataset commands

# Merging Files: example

idno	var1	var2	var3	var4	_merge
1	a <sub>1</sub>	$b_1$	<i>C</i> <sub>1</sub>	$d_1$	3
2	$a_2$	$b_2$			1
3	$a_3$	$b_3$	<i>C</i> 3	$d_3$	3
4			<i>C</i> 4	$d_4$	2

Merging Data: Combined Files

Basics Appending Datasets Merging Datasets Other dataset commands

# **Ensuring Uniqueness**

- Usually, should only be one observation per unique identifier
- May not be the case (e.g. adding family-level data to individual-level data)
- If there should be one observation per identifier in both datasets, use the command merge 1:1
- If each record in current dataset corresponds to several in the merged dataset, use merge 1:m
- Equally, there are merge m:1 and merge 1:m commands

Basics Appending Datasets Merging Datasets Other dataset commands

#### browse & edit

- Can open a data editor window with browse
- Can choose variables to browse with browse varlist
- Cannot modify data while browsing
- edit allows data to be changed: don't use it

Basics Appending Datasets Merging Datasets Other dataset commands

#### preserve & restore

- You may wish to change your data temporarily
- E.g. collapse to means by group
- Type preserve before changing data, restore after
