MAGIC: Ergodic Theory Lecture 10 - The ergodic theory of hyperbolic dynamical systems

Charles Walkden

April 12, 2013

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

In the last two lectures we studied thermodynamic formalism in the context of one-sided aperiodic shifts of finite type.

In the last two lectures we studied thermodynamic formalism in the context of one-sided aperiodic shifts of finite type.

In this lecture we use symbolic dynamics to model more general hyperbolic dynamical systems. We can then use thermodynamic formalism to prove ergodic-theoretic results about such systems.

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let $T_x M$ be the tangent space at $x \in M$.

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Let $T_x M$ be the tangent space at $x \in M$.

Let $D_X T : T_X M \to T_{T_X} M$ be the derivative of T.

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Let $T_x M$ be the tangent space at $x \in M$.

Let $D_X T : T_X M \to T_{T_X} M$ be the derivative of T.

Idea: At each point $x \in M$, there are two directions:

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Let $T_x M$ be the tangent space at $x \in M$.

Let $D_x T : T_x M \to T_{T_x} M$ be the derivative of T.

Idea: At each point $x \in M$, there are two directions:

- ► *T* contracts exponentially fast in one direction.
- T expands exponentially fast in the other.

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Let $T_x M$ be the tangent space at $x \in M$.

Let $D_x T : T_x M \to T_{T_x} M$ be the derivative of T.

Idea: At each point $x \in M$, there are two directions:

- ► T contracts exponentially fast in one direction.
- T expands exponentially fast in the other.

Definition

 $T: M \to M$ is an Anosov diffeomorphism if $\exists C > 0, \lambda \in (0, 1)$ s.t. $\forall x \in M$, there is a splitting

$$T_x M = E_x^s \oplus E_x^u$$

into DT-invariant sub-bundles E^s , E^u s.t.

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Definition

 $T: M \to M$ is an Anosov diffeomorphism if $\exists C > 0, \lambda \in (0, 1)$ s.t. $\forall x \in M$, there is a splitting

$$T_x M = E_x^s \oplus E_x^u$$

into DT-invariant sub-bundles E^s , E^u s.t.

 $\|D_{x}T^{n}(v)\| \leq C\lambda^{n}\|v\| \,\,\forall v \in E_{x}^{s}, \,\,\forall n \geq 0$

Let T be a C^1 diffeomorphism of a compact Riemannian manifold M.

Let $T_x M$ be the tangent space at $x \in M$.

Let $D_x T : T_x M \to T_{T_x} M$ be the derivative of T.

Idea: At each point $x \in M$, there are two directions:

- ► *T* contracts exponentially fast in one direction.
- T expands exponentially fast in the other.

Definition

 $T: M \to M$ is an Anosov diffeomorphism if $\exists C > 0, \lambda \in (0, 1)$ s.t. $\forall x \in M$, there is a splitting

$$T_x M = E_x^s \oplus E_x^u$$

into DT-invariant sub-bundles E^s , E^u s.t.

$$\begin{aligned} \|D_x T^n(v)\| &\leq C\lambda^n \|v\| \ \forall v \in E_x^s, \ \forall n \geq 0\\ \|D_x T^{-n}(v)\| &\leq C\lambda^n \|v\| \ \forall v \in E_x^u, \ \forall n \geq 0. \end{aligned}$$

 E^{s} , E^{u} are called the *stable* and *unstable* sub-bundles, respectively.

・ロト・日本・モート モー うへで

$$W^{s}(x) = \{ y \in M \mid d(T^{n}x, T^{n}y) \to 0 \text{ as } n \to \infty \}.$$
 (†)

$$W^{s}(x) = \{ y \in M \mid d(T^{n}x, T^{n}y) \to 0 \text{ as } n \to \infty \}.$$
 (†)

(The convergence in (†) is necessarily exponentially fast.)

$$W^{s}(x) = \{ y \in M \mid d(T^{n}x, T^{n}y) \to 0 \text{ as } n \to \infty \}.$$
 (†)

(The convergence in (†) is necessarily exponentially fast.)

Similarly, E^u is tangent to the unstable foliation W^u comprising of unstable manifolds $W^u(x)$.

$$W^{s}(x) = \{ y \in M \mid d(T^{n}x, T^{n}y) \to 0 \text{ as } n \to \infty \}.$$
 (†)

(The convergence in (†) is necessarily exponentially fast.)

Similarly, E^u is tangent to the unstable foliation W^u comprising of unstable manifolds $W^u(x)$. $W^u(x)$ is characterised by

$$W^{u}(x) = \{y \in M \mid d(T^{-n}x, T^{-n}y) \to 0 \text{ as } n \to \infty\}.$$

Open Question: Which manifolds support Anosov diffeomorphisms? A hyperbolic (= no eigenvalues of modulus 1) toral automorphism is Anosov.

A hyperbolic (= no eigenvalues of modulus 1) toral automorphism is Anosov.

A hyperbolic toral automorphism can be thought of in the following way:

A hyperbolic (= no eigenvalues of modulus 1) toral automorphism is Anosov.

A hyperbolic toral automorphism can be thought of in the following way:

 \mathbb{R}^k is an additive group and $\mathbb{Z}^k \subset \mathbb{R}^k$ is a cocompact lattice (i.e. a discrete subgroup such that $\mathbb{R}^k/\mathbb{Z}^k$ is compact). If A is a $k \times k$ integer matrix with det $A = \pm 1$ then A is an automorphism of \mathbb{R}^k that preserves the lattice \mathbb{Z}^k .
A hyperbolic (= no eigenvalues of modulus 1) toral automorphism is Anosov.

Remark

In general, rectangles may be (geometrically) very complicated. For Anosov automorphisms of a k-dimensional torus, $k \ge 3$, the boundary of a Markov partition will typically be a fractal.

Ergodic theory and hyperbolic dynamics

We want to use the thermodynamic formalism to study a hyperbolic map $T : \Lambda \to \Lambda$. Note that T is invertible, so the symbolic model $\sigma : \Sigma \to \Sigma$ is 2-sided.

Ergodic theory and hyperbolic dynamics

We want to use the thermodynamic formalism to study a hyperbolic map $T : \Lambda \to \Lambda$. Note that T is invertible, so the symbolic model $\sigma : \Sigma \to \Sigma$ is 2-sided. In previous lectures, thermodynamic formalism was defined for 1-sided shifts of finite type.

Ergodic theory and hyperbolic dynamics

We want to use the thermodynamic formalism to study a hyperbolic map $T : \Lambda \to \Lambda$. Note that T is invertible, so the symbolic model $\sigma : \Sigma \to \Sigma$ is 2-sided. In previous lectures, thermodynamic formalism was defined for 1-sided shifts of finite type.

Let
$$\Sigma =$$
 two sided shift of finite type

- Let $\Sigma = two sided shift of finite type$
 - $d_{\theta} =$ metric given by $\theta^{|\text{first disagreement}|}$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Let $\Sigma =$ two sided shift of finite type $d_{\theta} =$ metric given by $\theta^{|\text{first disagreement}|}$ $F_{\theta}(\Sigma, \mathbb{R}) =$ {functions $f : \Sigma \to \mathbb{R}$ that are θ -Hölder}.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let $\Sigma =$ two sided shift of finite type $d_{\theta} =$ metric given by $\theta^{|\text{first disagreement}|}$ $F_{\theta}(\Sigma, \mathbb{R}) =$ {functions $f : \Sigma \to \mathbb{R}$ that are θ -Hölder}.

If $x = (x_j)_{j=-\infty}^{\infty} \in \Sigma$ then we think of $(x_j)_{j=0}^{\infty}$ as "the future" and $(x_j)_{-\infty}^0$ as "the past".

Let $\Sigma =$ two sided shift of finite type $d_{\theta} =$ metric given by $\theta^{|\text{first disagreement}|}$ $F_{\theta}(\Sigma, \mathbb{R}) =$ {functions $f : \Sigma \to \mathbb{R}$ that are θ -Hölder}.

If $x = (x_j)_{j=-\infty}^{\infty} \in \Sigma$ then we think of $(x_j)_{j=0}^{\infty}$ as "the future" and $(x_j)_{-\infty}^0$ as "the past". Note that if $f \in F_{\theta(\Sigma,\mathbb{R})}$ then, typically, f(x) will depend both on the future and the past.

Let $\Sigma =$ two sided shift of finite type $d_{\theta} =$ metric given by θ |first disagreement| $F_{\theta}(\Sigma, \mathbb{R}) =$ {functions $f : \Sigma \to \mathbb{R}$ that are θ -Hölder}.

If $x = (x_j)_{j=-\infty}^{\infty} \in \Sigma$ then we think of $(x_j)_{j=0}^{\infty}$ as "the future" and $(x_j)_{-\infty}^0$ as "the past". Note that if $f \in F_{\theta(\Sigma,\mathbb{R})}$ then, typically, f(x) will depend both on the future and the past.

If f only depends on future coordinates, i.e.

$$f(x) = f(x_0, x_1, \dots)$$

then f can be regarded as being defined on the one-sided shift $f: \Sigma^+ \to \mathbb{R}.$

Recall: two functions $f, g: \Sigma \to \mathbb{R}$ are cohomologous if $\exists u \text{ s.t.}$

$$f=g+u\sigma-u.$$

Recall: two functions $f, g : \Sigma \to \mathbb{R}$ are cohomologous if $\exists u \text{ s.t.}$

$$f=g+u\sigma-u.$$

Cohomologous functions have the same dynamic behaviour: if f, g are cohomologous then

$$\sum_{j=0}^{n-1} f(\sigma^{j} x) = \sum_{j=0}^{n-1} g(\sigma^{j} x) + u(\sigma^{n} x) - u(x)$$

Recall: two functions $f, g : \Sigma \to \mathbb{R}$ are cohomologous if $\exists u \text{ s.t.}$

$$f=g+u\sigma-u.$$

Cohomologous functions have the same dynamic behaviour: if f, g are cohomologous then

$$\sum_{j=0}^{n-1} f(\sigma^{j}x) = \sum_{j=0}^{n-1} g(\sigma^{j}x) + u(\sigma^{n}x) - u(x)$$
$$= \sum_{j=0}^{n-1} g(\sigma^{j}x) + O(1).$$

Recall: two functions $f, g : \Sigma \to \mathbb{R}$ are cohomologous if $\exists u \text{ s.t.}$

$$f=g+u\sigma-u.$$

Cohomologous functions have the same dynamic behaviour: if f, g are cohomologous then

$$\sum_{j=0}^{n-1} f(\sigma^{j}x) = \sum_{j=0}^{n-1} g(\sigma^{j}x) + u(\sigma^{n}x) - u(x)$$
$$= \sum_{j=0}^{n-1} g(\sigma^{j}x) + O(1).$$

Theorem

Let $f \in F_{\theta}(\Sigma, \mathbb{R})$. Then f is cohomologous to a function $g \in F_{\theta^{\frac{1}{2}}}(\Sigma^+, \mathbb{R})$ that depends only on the future.

1. start with a hyperbolic $T : \Lambda \to \Lambda$

- 1. start with a hyperbolic $T : \Lambda \to \Lambda$
- 2. code the dynamics of T by a 2-sided shift of finite type Σ with coding map $\pi: \Sigma \to \Lambda$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- 1. start with a hyperbolic $T : \Lambda \to \Lambda$
- 2. code the dynamics of T by a 2-sided shift of finite type Σ with coding map $\pi: \Sigma \to \Lambda$
- 3. if $f : \Lambda \to \mathbb{R}$ is Hölder then $\hat{f} = f\pi \in F_{\theta}(\Sigma, \mathbb{R})$ for some $\theta \in (0, 1)$.

Let $\mu_f = \nu_f \circ \pi^{-1}$. Then μ_f is called an equilibrium state for f and is a *T*-invariant measure.

Application 2: SRB and physical measures

Let X be a compact Riemannian manifold equipped with the Riemannian volume m.

Application 2: SRB and physical measures

Let X be a compact Riemannian manifold equipped with the Riemannian volume m.

Let $T : X \to X$ be a smooth diffeomorphism. Typically T does not preserve the volume m. Even if m is T-invariant, then it need not be ergodic.

What can we say about

$$\lim_{n\to\infty}\frac{1}{n}\sum_{j=0}^{n-1}f(T^jx)$$

for *m*-a.e. $x \in X$?

Let $T : X \to X$ be a smooth diffeomorphism of a compact Riemannian manifold X.

Let $T : X \to X$ be a smooth diffeomorphism of a compact Riemannian manifold X. Let μ be an ergodic measure.

Let $T : X \to X$ be a smooth diffeomorphism of a compact Riemannian manifold X. Let μ be an ergodic measure. As X is compact, we know that $C(X, \mathbb{R})$ is separable.

Let $T : X \to X$ be a smooth diffeomorphism of a compact Riemannian manifold X. Let μ be an ergodic measure. As X is compact, we know that $C(X, \mathbb{R})$ is separable. It follows easily from Birhoff's Ergodic Theorem that $\exists N, \mu(N) = 1$ s.t.

$$\frac{1}{n}\sum_{j=0}^{n-1}f(T^jx)\longrightarrow\int f\,d\mu\,\forall x\in N.$$

Let $T : X \to X$ be a smooth diffeomorphism of a compact Riemannian manifold X. Let μ be an ergodic measure. As X is compact, we know that $C(X, \mathbb{R})$ is separable. It follows easily from Birhoff's Ergodic Theorem that $\exists N, \mu(N) = 1$ s.t.

$$\frac{1}{n}\sum_{j=0}^{n-1}f(T^jx)\longrightarrow \int f\,d\mu\,\forall x\in N.$$

(i.e. the set of full measure for which the ergodic sums of continuous observables converges can be chosen to be independent of the observables).

Suppose $T : X \to X$ contains a locally maximal attractor, $T : \Lambda \to \Lambda$ (not necessarily hyperbolic). The *basin of attraction* $B(\Lambda)$ is the set of points that converge under forward iteration to Λ .

Idea:

Idea: We think of *m*-a.e. point as being 'typical', in the sense that *m* is a naturally occurring measure.

Idea: We think of *m*-a.e. point as being 'typical', in the sense that *m* is a naturally occurring measure. Question:

Idea: We think of *m*-a.e. point as being 'typical', in the sense that *m* is a naturally occurring measure. Question: What happens to ergodic sums of continuous observables for *m*-a.e. point? i.e. does $\lim_{n\to\infty} \frac{1}{n} \sum_{j=0}^{n-1} f(T^j x)$ exist for all continuous *f*, *m*-a.e., and what is the limit?

Then S is an attractor with basin $S^1 \setminus \{N\}$.

Then S is an attractor with basin $S^1 \setminus \{N\}$. Let $f \in C(X, \mathbb{R})$.

Then S is an attractor with basin $S^1 \setminus \{N\}$. Let $f \in C(X, \mathbb{R})$. As $T^n x \to S \ \forall x \in S^1 \setminus \{N\}$, we have

$$\frac{1}{n}\sum_{j=0}^{n-1}f(T^jx)\longrightarrow f(S)=\int f\,d\delta_S.$$

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Let $T : \Lambda \to \Lambda$ be an attractor. A *T*-invariant probability measure μ is an *SRB (Sinai-Ruelle-Bowen) measure* if

$$\frac{1}{n}\sum_{j=0}^{n-1}f(T^jx)\longrightarrow\int f\,d\mu$$

almost everywhere on $B(\Lambda)$ w.r.t. the Riemannian volume m.
