

## 10. Advanced Turbulence Modelling

---

---

---

---

---

---

---

---

### Part 1. Models

#### Part 2. Implementation

---

---

---

---

---

---

---

---

### Turbulence Modelling

#### Purpose:

- model turbulent fluxes  $\overline{u_i u_j}$  and  $\overline{u_i \phi}$

#### in order to:

- close the mean flow equations
- quantify mixing

---

---

---

---

---

---

---

---

## Types of Turbulence Model

### Reynolds-Averaged Navier-Stokes (RANS) Models

- **Eddy-viscosity models (EVM):**
  - (deviatoric) stress proportional to mean strain
- **Non-linear eddy-viscosity models (NLEVM):**
  - stress is a non-linear function of mean strain and vorticity
- **Differential stress models (DSM) / Reynolds-stress transport models (RSTM):**
  - solve transport equations for all Reynolds stresses

### Models That Compute Fluctuating Quantities

- **Large-eddy simulation (LES):**
  - time-dependent calculation; model subgrid-scale motions
- **Direct numerical simulation (DNS):**
  - time-dependent calculation; resolve all scales of motion

---

---

---

---

---

---

---

---

---

---

## Eddy-Viscosity Models

$$-\overline{\rho u_i u_j} = \mu_t \left( \frac{\partial U_i}{\partial x_j} + \frac{\partial U_j}{\partial x_i} \right) - \frac{2}{3} \rho k \delta_{ij}$$

$$-\overline{\rho u v} = \mu_t \left( \frac{\partial U}{\partial y} + \frac{\partial V}{\partial x} \right)$$

$$-\overline{\rho u^2} = 2\mu_t \frac{\partial U}{\partial x} - \frac{2}{3} \rho k$$

Lumped in with pressure:

$$-\rho \delta_{ij} + \tau_{ij} = -\left( p + \frac{2}{3} \rho k \right) \delta_{ij} + \tau_{ij}^{(deviatoric)}$$

- This is a **model!**
- $\mu$  is a property of the **fluid**;  $\mu_t$  is a property of the **flow**
- $\mu_t$  varies with **position**
- $\mu_t \gg \mu$  throughout much of the flow

---

---

---

---

---

---

---

---

---

---

## k-ε Models

Eddy viscosity:  $\nu_t = C_\mu \frac{k^2}{\epsilon}$

Turbulent transport equations:

$$\rho \frac{Dk}{Dt} = \frac{\partial}{\partial x_i} \left( \Gamma^{(k)} \frac{\partial k}{\partial x_i} \right) + \rho (P^{(k)} - \epsilon)$$

$$\rho \frac{D\epsilon}{Dt} = \frac{\partial}{\partial x_i} \left( \Gamma^{(\epsilon)} \frac{\partial \epsilon}{\partial x_i} \right) + \rho (C_{1\epsilon} P^{(k)} - C_{2\epsilon} \epsilon) \frac{\epsilon}{k}$$

rate of change      diffusion      production      dissipation

$$\Gamma^{(k)} = \mu + \frac{\mu_t}{\sigma^{(k)}} \quad P^{(k)} = -u_i u_j \frac{\partial U_i}{\partial x_j}$$

$$\Gamma^{(\epsilon)} = \mu + \frac{\mu_t}{\sigma^{(\epsilon)}}$$

---

---

---

---

---

---

---

---

---

---

## k- $\omega$ Models

Eddy viscosity:  $\nu_t = \frac{k}{\omega}$

Turbulent transport equations:

$$\rho \frac{Dk}{Dt} = \frac{\partial}{\partial x_j} \left( \Gamma^{(k)} \frac{\partial k}{\partial x_j} \right) + \rho (P^{(k)} - \beta^* \omega k)$$

$$\rho \frac{D\omega}{Dt} = \frac{\partial}{\partial x_j} \left( \Gamma^{(\omega)} \frac{\partial \omega}{\partial x_j} \right) + \rho \left( \frac{\alpha}{\nu_t} P^{(\omega)} - \beta \omega^2 \right)$$

---

---

---

---

---

---

---

---

## Eddy-Viscosity Models - Assessment

### For

- Easy to implement in viscous solvers
- Extra viscosity aids stability
- Theoretical justification in simple flows

### Against

- Lack of turbulence physics; (particularly **anisotropy** and **history** effects)
- Based on a single scalar  $\mu_t$ ; at most one stress component can be predicted accurately

---

---

---

---

---

---

---

---

## Eddy-Viscosity Models in Simple Shear

$$-\rho \overline{u_i u_j} = \mu_t \left( \frac{\partial U_i}{\partial x_j} + \frac{\partial U_j}{\partial x_i} \right) - \frac{2}{3} \rho k \delta_{ij}$$

Shear stress:  $-\rho \overline{uv} = \mu_t \frac{\partial U}{\partial y}$

Normal stresses:  $\overline{u^2} = \overline{v^2} = \overline{w^2} = \frac{2}{3} k$

Experiment:  $\overline{u^2} : \overline{v^2} : \overline{w^2} = 1.0 : 0.4 : 0.6$   
**anisotropy**

---

---

---

---

---

---

---

---

## Non-Linear Eddy-Viscosity Models

**Linear EVM:**  $\overline{u_i u_j} = -\nu_t \left( \frac{\partial U_i}{\partial x_j} + \frac{\partial U_j}{\partial x_i} \right) + \frac{2}{3} k \delta_{ij}$   $\nu_t = C_\nu \frac{k^2}{\varepsilon}$

$\overline{u_i u_j} - \frac{2}{3} k \delta_{ij} = -2\nu_t S_{ij}$  **strain:**  $S_{ij} = \frac{1}{2} \left( \frac{\partial U_i}{\partial x_j} + \frac{\partial U_j}{\partial x_i} \right)$

$\frac{\overline{u_i u_j}}{k} - \frac{2}{3} \delta_{ij} = -2C_\mu \frac{k}{\varepsilon} S_{ij}$  **vorticity:**  $\Omega_{ij} = \frac{1}{2} \left( \frac{\partial U_i}{\partial x_j} - \frac{\partial U_j}{\partial x_i} \right)$

$a_{ij} = -2C_\mu s_{ij}$  **anisotropy:**  $a_{ij} = \frac{\overline{u_i u_j}}{k} - \frac{2}{3} \delta_{ij}$

$\mathbf{a} = -2C_\mu \mathbf{s}$   $s_{ij} = \frac{k}{\varepsilon} S_{ij}, \quad \omega_{ij} = \frac{k}{\varepsilon} \Omega_{ij}$

**Non-linear EVM:**  $\mathbf{a} = -2C_\mu \mathbf{s} + \mathbf{NL}(\mathbf{s}, \boldsymbol{\omega})$

---

---

---

---

---

---

---

---

---

---

---

## Quadratic NLEVM

$\mathbf{a} = -2C_\mu \mathbf{s} + \beta_1 (\mathbf{s}^2 - \frac{1}{3} \{\mathbf{s}^2\} \mathbf{I}) + \beta_2 (\boldsymbol{\omega} \mathbf{s} - \mathbf{s} \boldsymbol{\omega}) + \beta_3 (\boldsymbol{\omega}^2 - \frac{1}{3} \{\boldsymbol{\omega}^2\} \mathbf{I})$

Quadratic terms admit **anisotropy** in simple shear:

$$\frac{\overline{u^2}}{k} = \frac{2}{3} + (\beta_1 + 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$$

$$\frac{\overline{v^2}}{k} = \frac{2}{3} + (\beta_1 - 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$$

$$\frac{\overline{w^2}}{k} = \frac{2}{3} - (\beta_1 - \beta_3) \frac{\sigma^2}{6}$$

$\sigma = \frac{k}{\varepsilon} \frac{\partial U}{\partial y}$

---

---

---

---

---

---

---

---

---

---

---

## General Non-linear Eddy-Viscosity Model

$\mathbf{a} = \sum_{\alpha=1}^{10} C_\alpha \mathbf{T}_\alpha(\mathbf{s}, \boldsymbol{\omega})$

- **10 bases**
  - symmetric
  - traceless
- **Quintic**

---

---

---

---

---

---

---

---

---

---

---

**Linear:**  $T_1 = \mathbf{s}$

**Quadratic:**  $T_2 = \mathbf{s}^2 - \frac{1}{3}\{\mathbf{s}^2\}\mathbf{I}$   
 $T_3 = \boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega}$   
 $T_4 = \boldsymbol{\omega}^2 - \frac{1}{3}\{\boldsymbol{\omega}^2\}\mathbf{I}$

Vanish in 2d

**Cubic:**  $T_5 = \boldsymbol{\omega}^2\mathbf{s} + \mathbf{s}\boldsymbol{\omega}^2 - \{\boldsymbol{\omega}^2\}\mathbf{s} - \frac{2}{3}\{\mathbf{s}^2\boldsymbol{\omega}^2\}\mathbf{I}$   
 $T_6 = \boldsymbol{\omega}\mathbf{s}^2 - \mathbf{s}^2\boldsymbol{\omega}$

**Quartic:**  $T_7 = \boldsymbol{\omega}^2\mathbf{s}^2 + \mathbf{s}^2\boldsymbol{\omega}^2 - \frac{2}{3}\{\mathbf{s}^2\boldsymbol{\omega}^2\}\mathbf{I} - \{\boldsymbol{\omega}^2\}(\mathbf{s}^2 - \frac{1}{3}\{\mathbf{s}^2\}\mathbf{I})$   
 $T_8 = \mathbf{s}^2\boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega}\mathbf{s}^2 - \frac{1}{2}\{\mathbf{s}^2\}(\boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega})$   
 $T_9 = \boldsymbol{\omega}\mathbf{s}\boldsymbol{\omega}^2 - \boldsymbol{\omega}^2\mathbf{s}\boldsymbol{\omega} - \frac{1}{2}\{\boldsymbol{\omega}^2\}(\boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega})$

**Quintic:**  $T_{10} = \boldsymbol{\omega}\mathbf{s}^2\boldsymbol{\omega}^2 - \boldsymbol{\omega}^2\mathbf{s}^2\boldsymbol{\omega}$

---

---

---

---

---

---

---

---

### Cubic Eddy-Viscosity Model

$\mathbf{a} = -2C_\mu f_\mu \mathbf{s}$

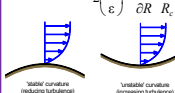

$+\beta_1(\mathbf{s}^2 - \frac{1}{3}\{\mathbf{s}^2\}\mathbf{I}) + \beta_2(\boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega}) + \beta_3(\boldsymbol{\omega}^2 - \frac{1}{3}\{\boldsymbol{\omega}^2\}\mathbf{I})$

$-\gamma_1\{\mathbf{s}^2\}\mathbf{s} - \gamma_2\{\boldsymbol{\omega}^2\}\mathbf{s} - \gamma_3(\boldsymbol{\omega}^2\mathbf{s} + \mathbf{s}\boldsymbol{\omega}^2 - \{\boldsymbol{\omega}^2\}\mathbf{s} - \frac{2}{3}\{\mathbf{s}^2\boldsymbol{\omega}^2\}\mathbf{I}) - \gamma_4(\boldsymbol{\omega}\mathbf{s}^2 - \mathbf{s}^2\boldsymbol{\omega})$

**cubic terms ↔ curvature**

$\{\mathbf{s}^2\} + \{\boldsymbol{\omega}^2\} \equiv 2(s_{12}^2 - \omega_{12}^2)$

$= -2\left(\frac{k}{\varepsilon}\right)^2 \frac{\partial U_x}{\partial R} \frac{U_x}{R_c}$

Stable curvature (reducing turbulence)      Unstable curvature (increasing turbulence)

**quadratic terms ↔ anisotropy**

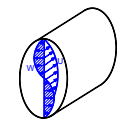

$\frac{\overline{u^2}}{k} = \frac{2}{3} + (\beta_1 + 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$

$\frac{\overline{v^2}}{k} = \frac{2}{3} + (\beta_1 - 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$

$\frac{\overline{w^2}}{k} = \frac{2}{3} - (\beta_1 - \beta_3) \frac{\sigma^2}{6}$

$\sigma = \frac{k}{\varepsilon} \frac{\partial U}{\partial y}$

**cubic term ↔ swirl**

---

---

---

---

---

---

---

---

### Properties of the Non-Linear Relationship

In 2-d incompressible flow:

$$\mathbf{s} = \begin{pmatrix} s_{11} & s_{12} & 0 \\ s_{12} & -s_{11} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \boldsymbol{\omega} = \begin{pmatrix} 0 & \omega_{12} & 0 \\ -\omega_{12} & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\mathbf{s}^2 = (s_{11}^2 + s_{12}^2) \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\boldsymbol{\omega}^2 = -\omega_{12}^2 \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\boldsymbol{\omega}\mathbf{s} - \mathbf{s}\boldsymbol{\omega} = 2\omega_{12}s_{12} \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 0 \end{pmatrix} - 2\omega_{12}s_{11} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

---

---

---

---

---

---

---

---

## Properties of the Non-Linear Relationship

$$\mathbf{a} = -2C_{\mu} f_{\mu} \mathbf{s} + \beta_1 (\mathbf{s}^2 - \frac{1}{3} \{\mathbf{s}^2\} \mathbf{I}) + \beta_2 (\boldsymbol{\omega} \mathbf{s} - \mathbf{s} \boldsymbol{\omega}) + \beta_3 (\boldsymbol{\omega}^2 - \frac{1}{3} \{\boldsymbol{\omega}^2\} \mathbf{I}) - \gamma_1 \{\mathbf{s}^2\} \mathbf{s} - \gamma_2 \{\boldsymbol{\omega}^2\} \mathbf{s} - \gamma_3 (\boldsymbol{\omega}^2 \mathbf{s} + \mathbf{s} \boldsymbol{\omega}^2 - \{\boldsymbol{\omega}^2\} \mathbf{s} - \frac{2}{3} \{\boldsymbol{\omega} \mathbf{s} \boldsymbol{\omega}\} \mathbf{I}) - \gamma_4 (\boldsymbol{\omega} \mathbf{s}^2 - \mathbf{s}^2 \boldsymbol{\omega})$$

1. In 2-d incompressible flow:

$$\mathbf{s}^2 = (s_{11}^2 + s_{12}^2) \mathbf{I}_2 = \frac{1}{2} \{\mathbf{s}^2\} \mathbf{I}_2$$

$$\boldsymbol{\omega}^2 = -\omega_{12}^2 \mathbf{I}_2 = \frac{1}{2} \{\boldsymbol{\omega}^2\} \mathbf{I}_2$$

$$\mathbf{s}^2 = (s_{11}^2 + s_{12}^2) \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix},$$

$$\boldsymbol{\omega}^2 = -\omega_{12}^2 \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

2. (a) In any incompressible flow:

$$\frac{P^{(k)}}{\varepsilon} = -a_{ij} s_{ij} = -\{\mathbf{a}\mathbf{s}\}$$

(b) In 2-d incompressible flow, the quadratic terms do not contribute to the production of turbulent kinetic energy

3. In 2-d incompressible flow, the  $\gamma_3$ - and  $\gamma_4$ -related cubic terms vanish

---

---

---

---

---

---

---

---

4. In simple shear the quadratic terms yield **anisotropy**

$$\frac{\overline{u'^2}}{k} = \frac{2}{3} + (\beta_1 + 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$$

$$\frac{\overline{v'^2}}{k} = \frac{2}{3} + (\beta_1 - 6\beta_2 - \beta_3) \frac{\sigma^2}{12}$$

$$\frac{\overline{w'^2}}{k} = \frac{2}{3} - (\beta_1 - \beta_3) \frac{\sigma^2}{6}$$

5. The  $\gamma_1$  and  $\gamma_2$  terms yield sensitivity to **curvature**

$$\frac{\partial U}{\partial y} = \frac{\partial U_x}{\partial R}, \quad \frac{\partial V}{\partial x} = -\frac{U_x}{R_c}$$

$$\{\mathbf{s}^2\} + \{\boldsymbol{\omega}^2\} = -2 \left(\frac{k}{\varepsilon}\right)^2 \frac{\partial U_x}{\partial R} \frac{U_x}{R_c}$$

6. In 3-d flows, the  $\gamma_4$  term evokes sensitivity to **swirl**

---

---

---

---

---

---

---

---

## Reynolds-Stress Transport Equations

Fluctuating momentum equation:  $\frac{\partial u_i}{\partial t} = \dots$

Form  $u_j \times \frac{\partial u_i}{\partial t} + u_i \times \frac{\partial u_j}{\partial t} = \dots$  and average

---

---

---

---

---

---

---

---

## Reynolds-Stress Transport Equations

$$\frac{\partial}{\partial t} (\overline{u_i u_j}) + U_k \frac{\partial}{\partial x_k} (\overline{u_i u_j}) = \frac{\partial}{\partial x_k} \left[ \nu \frac{\partial}{\partial x_k} (\overline{u_i u_j}) - \frac{1}{\rho} \overline{p(u_i \delta_{jk} + u_j \delta_{ik}) - u_i u_j u_k} \right] - \overline{(u_i u_k \frac{\partial U_j}{\partial x_k} + u_j u_k \frac{\partial U_i}{\partial x_k})} + \overline{u_i f_j + u_j f_i} + \frac{p}{\rho} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right) - 2\nu \overline{\frac{\partial u_i}{\partial x_k} \frac{\partial u_j}{\partial x_k}}$$

$$\rho \frac{D}{Dt} (\overline{u_i u_j}) = \frac{\partial d_{ijk}}{\partial x_k} + \rho ( P_{ij} + F_{ij} + \Phi_{ij} - \epsilon_{ij} )$$

---

---

---

---

---

---

---

---

## Differential Stress Models

$\rho \frac{D}{Dt} (\overline{u_i u_j})$	$=$	$\frac{\partial d_{ijk}}{\partial x_k}$	$+$	$\rho ($	$P_{ij}$	$+$	$F_{ij}$	$+$	$\Phi_{ij}$	$-$	$\epsilon_{ij}$	$)$
RATE OF CHANGE & ADVECTION Exact					PRODUCTION by mean flow Exact		PRODUCTION by body forces Exact				DISSIPATION by viscosity Modelled $\epsilon_{11} = \epsilon_{22} = \epsilon_{33} = \frac{2}{3} \epsilon$ $\epsilon_{23} = \epsilon_{31} = \epsilon_{12} = 0$	
DIFFUSION Modelled $d_{ijk} = (\mu \delta_{ij} + C_s \frac{\rho k u_i u_j}{\epsilon}) \frac{\partial}{\partial x_k} (\overline{u_i u_j})$												
		PRESSURE-STRAIN Modelled $\Phi_{ij} = \Phi_{ij}^{(1)} + \Phi_{ij}^{(2)} + \Phi_{ij}^{(so)}$ $\Phi_{11}^{(1)} = -C_1 \frac{\epsilon}{k} (\overline{u^2} - \frac{2}{3} k)$ , $\Phi_{12}^{(1)} = -C_1 \frac{\epsilon}{k} \overline{uv}$ $\Phi_{11}^{(2)} = -C_2 (P_{11} - \frac{2}{3} P^{(k)})$ , $\Phi_{12}^{(2)} = -C_2 P_{12}$										

---

---

---

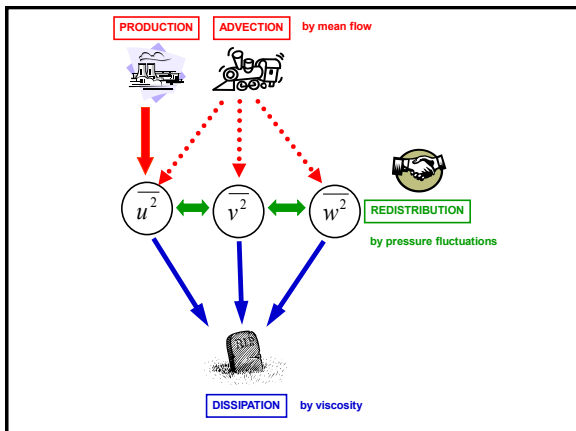

---

---

---

---

---

---

---

---

---

---

---

---

---

## Differential Stress Models

### Assessment

#### For

- Good turbulence physics
- Advection and production terms are exact

#### Against

- Significant modelling required
- Computationally demanding
- Numerical instability

---

---

---

---

---

---

---

---

## Differential Stress Models

### Classic References

- Basic DSM (Launder, Reece and Rodi, 1975; Gibson and Launder, 1978)
- Speziale, Sarkar and Gatski (1991):
  - non-linear  $\Phi_{ij}$ ; no wall reflection
- Craft (1996):
  - low-Re; wall-geometry-independent
- Jakirlić and Hanjalić (1995):
  - low-Re; anisotropic dissipation
- Wilcox (1988):
  - low-Re;  $\omega$ -based

---

---

---

---

---

---

---

---

#### Part 1. Models

## Part 2. Implementation

---

---

---

---

---

---

---

---

## Components of a Turbulence Model

1. A means of **specifying turbulent stresses**:
  - constitutive relation (eddy-viscosity models)  
or
  - transport equations for stresses (differential stress models)
2. Additional **scalar-transport equations**

---

---

---

---

---

---

---

---

## Considerations for the Mean-Flow Equations

- The turbulent flux is only partly diffusive:

$$-\overline{\rho uv} = \mu_t \left( \frac{\partial U}{\partial y} + \frac{\partial V}{\partial x} \right) + (\text{non-linear terms})$$

diffusive part                      non-diffusive part

- **Effective viscosities** can be used to stabilise differential stress models

---

---

---

---

---

---

---

---

## Considerations for the Turbulence Equations

- Turbulence equations are usually source-dominated
- Some variables (e.g.  $k$ ,  $\epsilon$ ) must be  $\geq 0$ :
  - bounded advection scheme
  - special treatment of the source term

---

---

---

---

---

---

---

---

## Source-Term Discretisation

$$a_p \phi_p - \sum_F a_F \phi_F = b_p + s_p \phi_p$$

**Stability**  $\longleftrightarrow s_p \leq 0$

**Positive  $\phi$**   $\longleftrightarrow b_p \geq 0$

If  $b_p < 0$  then write as:

$$b_p + s_p \phi_p \rightarrow \left( \frac{b_p}{\phi_p} + s_p \right) \phi_p$$

i.e.

$$s_p \rightarrow s_p + \frac{b_p}{\phi_p}$$

$$b_p \rightarrow 0$$

---

---

---

---

---

---

---

---

## Wall Boundary Conditions

### Near walls:

- No-slip condition applies
- Large flow gradients
- Preferential damping of wall-normal fluctuations
- Viscous and turbulent stresses comparable

### Use either:

- Fine grids and **low-Re turbulence models**
- Coarser grids and **wall functions**

---

---

---

---

---

---

---

---

## Low-Re Turbulence Models

- Resolve flow right to the boundary:

$$y^+ \equiv \frac{u_\tau y}{\nu} \leq 1, \quad u_\tau \equiv \sqrt{\tau_w / \rho}$$

- Include effects of molecular viscosity:

$$v_i = C_{\mu} f_{\mu} \frac{k^2}{\varepsilon} \quad C_{\varepsilon 1} \rightarrow C_{\varepsilon 1} f_1 \quad C_{\varepsilon 2} \rightarrow C_{\varepsilon 2} f_2$$

$$f_{\mu}, f_1, f_2 \text{ are functions of } \frac{u_\tau y}{\nu}, \frac{k^{1/2} y}{\nu} \text{ or } \frac{k^2}{\nu \varepsilon}$$

- Try to ensure correct asymptotic behaviour as  $y \rightarrow 0$ :

$$k \propto y^2, \quad \varepsilon \sim \frac{2\nu k}{y^2} \sim \text{constant}, \quad v_i \propto y^3 \quad (y \rightarrow 0)$$

---

---

---

---

---

---

---

---

### Example

(a) By expanding the fluctuating velocities in the form

$$\begin{aligned} u &= a_1 + b_1 y + c_1 y^2 + \dots \\ v &= a_2 + b_2 y + c_2 y^2 + \dots \\ w &= a_3 + b_3 y + c_3 y^2 + \dots \end{aligned}$$

show that

$$\overline{u^2} = b_1^2 y^2 + \dots$$

and derive similar expressions for

$$\overline{v^2}, \overline{w^2}, \overline{uv}, k, \nu_t$$

(b) Use the turbulent kinetic energy equation and the near-wall behaviour of  $k$  from above to show that the near-wall behaviour of  $\epsilon$  is

$$\epsilon \sim \frac{2\nu k}{y^2} \sim \text{constant} \quad (y \rightarrow 0)$$

---

---

---

---

---

---

---

---

### Wall Functions (High-Re Approach)

- Bridge (don't resolve) the viscosity-affected region, using theoretical boundary-layer profiles
- OK in equilibrium turbulence; dodgy near separation/reattachment
- Optimal near-wall spacing:  $30 < y^+ < 150$

---

---

---

---

---

---

---

---

### Wall Functions - Requirements

Variable	Required from wall function
$U, V, W$	Wall shear stress
$k, \overline{u_i u_j}$	Cell-averaged production and dissipation
$\epsilon$	Value at the near-wall node

---

---

---

---

---

---

---

---

## Wall Functions – Assumed Profiles

**Basis:**

$$\tau_w = \rho v_{eff} \frac{\partial U}{\partial y}$$

$$v_{eff} = v + v_t = v + \max\{0, \kappa u_w (y - y_w)\}$$

$$\varepsilon = \begin{cases} \varepsilon_w & (y \leq y_c) \\ \frac{u_w^3}{\kappa(y - y_w)} & (y > y_c) \end{cases}$$

$$u_w = C^{1/4} k_p^{1/2}$$

Generates a mean-velocity profile ...

$$\frac{U}{u_w} = \frac{\tau_w}{\rho u_w^2} \times \begin{cases} y^+ & y^+ \leq y_p^+ \\ y_p^+ + \frac{1}{\kappa} \ln\{1 + \kappa(y^+ - y_p^+)\} & y^+ \geq y_p^+ \end{cases} \quad y^+ \equiv \frac{y u_w}{\nu}$$

... which is inverted for the wall stress:

$$\tau_w = \frac{\rho v U_p}{y_p} \times \begin{cases} 1 & y_p^+ \leq y_w^+ \\ \frac{y_p^+}{y_w^+ + \frac{1}{\kappa} \ln\{1 + \kappa(y_p^+ - y_w^+)\}} & y_p^+ \geq y_w^+ \end{cases}$$

---

---

---

---

---

---

---

---

---

---

---

---

## Wall Functions - Implementation

Wall shear stress applied via an **effective wall viscosity**:

$$\tau_w = \rho v_{eff,wall} \frac{U_p}{y_p}$$

$$v_{eff,wall} = v \times \begin{cases} 1 & y_p^+ \leq y_w^+ \\ \frac{y_p^+}{y_w^+ + \frac{1}{\kappa} \ln\{1 + \kappa(y_p^+ - y_w^+)\}} & y_p^+ \geq y_w^+ \end{cases}$$

**Cell-averaged** production and dissipation:

$$P_{cell}^{(k)} \equiv \frac{1}{\Delta} \int_0^{\Delta} P^{(k)} dy = \frac{(\tau_w / \rho)^2}{\kappa u_w \Delta} \left\{ \ln[1 + \kappa(\Delta^+ - y_p^+)] - \frac{\kappa(\Delta^+ - y_p^+)}{1 + \kappa(\Delta^+ - y_p^+)} \right\}$$

$$\varepsilon_{cell} = \frac{1}{\Delta} \int_0^{\Delta} \varepsilon dy = \frac{u_w^3}{\kappa \Delta} \left[ \ln\left(\frac{\Delta - y_w}{y_c - y_w}\right) + \frac{y_c}{y_c - y_w} \right]$$

---

---

---

---

---

---

---

---

---

---

---

---

## Effective Viscosity To Stabilise DSMs

Differential stress models:

no turbulent viscosity → numerical instability

**Effective viscosity** approach – add and subtract a gradient term:

$$\overline{u_a u_b} = \overline{(u_a u_b + v_{eff} \frac{\partial u_a}{\partial x_b})} - v_{eff} \frac{\partial \overline{u_a}}{\partial x_b}$$

Simplest:  $v_{eff} = \nu_t = C_\mu \frac{k^2}{\varepsilon}$

Better:  $\overline{u^2} = -v_{11} \frac{\partial U}{\partial x} + \dots$   $v_{11} = 2 \left( \frac{1 - \frac{2}{3} C_2}{C_1} \right) \frac{k \overline{u^2}}{\varepsilon}$

$\overline{uv} = -v_{12} \frac{\partial U}{\partial y} + \dots$   $v_{12} = \left( \frac{1 - C_2}{C_1} \right) \frac{k \overline{v^2}}{\varepsilon}$
