

# An introduction to Stein's method

Nathan Ross (University of Melbourne)

## Three lectures

1. Basics and normal approximation
2. Poisson approximation
3. Multivariate and process approximation

# An introduction to Stein's method

## 1. Basics and normal approximation

<https://tinyurl.com/axps86dh>

Nathan Ross (University of Melbourne)

# Classical CLT

Assume

- ▶  $X_1, X_2, \dots$  iid,
- ▶  $\mathbb{E}X_i = 0$ ,  $\text{Var}(X_i) = 1$ ,
- ▶  $W = W_n = \frac{1}{\sqrt{n}} \sum_{i=1}^n X_i$ .

Then, for  $Z \sim \text{Normal}(0, 1)$  and  $x \in \mathbb{R}$ ,

$$\mathbb{P}(W_n \leq x) \rightarrow \mathbb{P}(Z \leq x).$$

# Berry-Esseen Theorem

Assume

- ▶  $X_1, X_2, \dots$  iid,
- ▶  $\mathbb{E}X_i = 0$ ,  $\text{Var}(X_i) = 1$ , and  $\mathbb{E}[|X_i|^3] < \infty$ ,
- ▶  $W = W_n = \frac{1}{\sqrt{n}} \sum_{i=1}^n X_i$ .

Then, for  $Z \sim \text{Normal}(0, 1)$  and  $x \in \mathbb{R}$ ,

$$|\mathbb{P}(W_n \leq x) - \mathbb{P}(Z \leq x)| \leq \frac{\mathbb{E}[|X_1|^3]}{\sqrt{n}}.$$

# Dependency Graph

We say  $X_1, X_2, \dots, X_n$  has **dependency graph**  $G$  with vertices  $\{1, \dots, n\}$  if

- ▶ for any two disjoint subsets  $\{i_1, \dots, i_k\}$  and  $\{j_1, \dots, j_m\}$  of vertices, with no edges between the two sets,

$(X_{i_1}, \dots, X_{i_k})$  is independent of  $(X_{j_1}, \dots, X_{j_m})$ .

Q: Under what conditions on **dependency graph**  $G$  is  $\sum_{i=1}^n X_i$  close in distribution to a normal distribution?

## Sleight of Hand

For random variables  $W$  and  $Z$ , define the **Wasserstein distance** between their distributions by

$$d_{\text{Lip}}(W, Z) = \sup_{h \in \text{Lip}_1} |\mathbb{E}h(W) - \mathbb{E}h(Z)|.$$

**Proposition:** If  $Z$  has density bounded by  $C$ , then

$$|\mathbb{P}(W \leq x) - \mathbb{P}(Z \leq x)| \leq \sqrt{(2C)d_{\text{Lip}}(W, Z)}.$$

# Stein's Method Framework

Three steps to Stein's method for a given target distribution of  $Z$ .

1. Characterizing operator  $\mathcal{A} = \mathcal{A}_Z$  on real valued functions:

$$\mathbb{E}\mathcal{A}f(X) = 0 \text{ wide class of functions } f \iff X \stackrel{d}{=} Z.$$

2. For given  $h$ , find Stein solution  $f_h$ :

$$\mathcal{A}f_h(x) = h(x) - \mathbb{E}h(Z) =: \tilde{h}(x).$$

3. Use structure of  $W$  and properties of  $f_h$  to bound

$$|\mathbb{E}\mathcal{A}f_h(W)| = |\mathbb{E}h(W) - \mathbb{E}h(Z)|.$$

For bound on  $d_{\text{Lip}}$ , take  $h \in \text{Lip}_1$ .

# Stein's Method for Normal Approximation

For random variable  $W$  and  $Z \sim \text{Normal}(0, 1)$ ,

$$d_{\text{Lip}}(W, Z) \leq \sup_{f \in \mathcal{F}} |\mathbb{E}[f'(W) - Wf(W)]|,$$

where

$$\mathcal{F} := \left\{ f : \|f\|_{\infty} \leq 2; \|f''\|_{\infty} \leq 2; \|f'\|_{\infty} \leq \sqrt{2/\pi} \right\}.$$

# Dependency Graph Bound

Assume

- ▶  $X_1, X_2, \dots, X_n$  has dependency graph with maximum degree bounded above by  $D$ .
- ▶  $\mathbb{E}X_i = 0$  and  $\mathbb{E}[X_i^4] < \infty$ .
- ▶  $W = \frac{1}{\sigma} \sum_{i=1}^n X_i$ , where  $\sigma^2 = \text{Var} \left( \sum_{i=1}^n X_i \right)$ .

Then, for  $Z \sim \text{Normal}(0, 1)$ ,

$$d_{\text{Lip}}(W, Z) \leq 3(D + 1)^2 \left( \frac{1}{\sigma^3} \sum_{i=1}^n \mathbb{E}[|X_i|^3] + \frac{1}{\sigma^2} \sqrt{\sum_{i=1}^n \mathbb{E}[X_i^4]} \right).$$

## Exercises

- ▶ (Easy) Apply the previous result directly to  $W$  equal to the (centered and scaled) number of triangles in an Erdős-Rényi random graph with  $m$  vertices and edge probability  $p$ , to derive a CLT for  $p = p_m \asymp m^{-\alpha}$  for  $0 \leq \alpha < 2/9$ .
- ▶ (Hard) In the setting of the previous exercise, derive a CLT in a greater range of  $\alpha$  by bounding  $|\mathbb{E}[f'(W) - Wf(W)]|$  directly using additional structure of  $W$  and Taylor expansion.
